

REMARKS

The present claims recite retinoid X receptor-interacting proteins that have an amino acid sequence at least 85% identical to that of RIP15.

Claims 7, 10, 13-16, and 27-31 were examined in this case. The amino acid sequence of RIP15 (SEQ ID NO: 3) was determined to be free of the prior art. Claims 7, 10, 13-16, and 27-31 stand rejected under 35 U.S.C. § 101 and § 112, first paragraph. Claims 7, 10, 13-14, 16, 27, 28, and 31 also stand rejected under 35 U.S.C. § 102(e). Each of these rejections is addressed as follows.

Support for the Amendment

New claim 32 recites RXR-interacting proteins that inhibit retinoid X receptor-dependent activation of a β -RARE-linked nucleic acid (as disclosed, for example, on page 40, lines 8 to 19).

No new matter is added by this amendment.

Objection to the Claims

The Examiner states that the application contains claim 37, which is drawn to a non-elected invention. Applicants note that the application only contains claims 1-31. Non-elected claims 1-6, 8, 9, 11, 12, and 17-26 have been canceled. Accordingly, this rejection may now be withdrawn.

Rejections under 35 U.S.C. § 101 and § 112, first paragraph

Claims 7, 10, 13-16, and 27-31 stand rejected under 35 U.S.C. § 101 and § 112, first paragraph, with the Examiner stating that the claimed invention is not supported by a substantial

or specific asserted utility or by a well established utility that would enable one skilled in the art to use the invention. For the following reasons, applicants respectively traverse these related rejections.

Standards for Satisfying the Utility Requirement

The Utility Examination Guidelines (66 CFR 1092-1099) and Revised Interim Utility Guidelines Training Materials outline the criteria to determine the utility of an invention. The utility of an invention must be specific and substantial or well-established. In defining the metes and bounds of a specific utility, the Revised Interim Utility Guidelines Training Materials require that:

a utility [be] specific to the subject matter claimed. This contrasts with a general utility that would be applicable to the broad class of the invention ... A general statement of diagnostic utility, such as diagnosing an unspecified disease, would ordinarily be insufficient absent a disclosure of what condition can be diagnosed. (paragraph bridging pages 5 and 6; emphasis added)

By implication, therefore, the specific utility of a particular protein may be established by the disclosure of a specific disease or condition with which it is associated.

Likewise, a substantial utility is established by a "real world" context of use, such as the identification of a material which has a correlation to, or impacts the onset or progression of a particular disease or condition. Specifically, the Revised Interim Utility Guidelines state:

both a therapeutic method of treating a known or newly discovered disease and an assay method for identifying compounds that themselves have a "substantial utility" define a "real world" context of use. An assay that measures the presence of a material which has a stated correlation to a predisposition to the onset of a particular disease condition would also define a "real world" context of use in identifying potential candidates for preventive measures or further monitoring. (page 6; emphasis added)

Thus, a component of an assay method for identifying candidate compounds which may be used

for treating a specific disease itself has substantial utility. Similarly, components of an assay method for measuring the presence of a material associated with a risk of disease have substantial utility.

Alternatively, the utility requirement of 35 U.S.C. § 101 can also be satisfied by identifying a well established utility which is defined in the Revised Interim Utility Guidelines Training Materials as:

A specific, substantial, and credible utility which is well known, immediately apparent, or implied by the specification's disclosure of the properties of a material, alone or taken with the knowledge of one skilled in the art. (page 7; emphasis added)

Of course, in evaluating the utility of the invention, the credibility of the disclosure must be assessed. Credibility must be viewed from the perspective of a person of ordinary skill in the art and should be based on the totality of the evidence (specification and prior art) and reasoning provided.

The Federal Circuit in *In re Brana*, 51 F.3d 1560 (Fed. Cir. 1995) has articulated the standard to be applied by the PTO in any challenge to an assertion of utility. In this case, the Court stated:

the PTO has the initial burden of challenging a presumptively correct assertion of utility in the disclosure. [citation omitted]. Only after the PTO provides evidence showing that one of ordinary skill in the art would reasonably doubt the asserted utility does the burden shift to the applicant to provide rebuttal evidence sufficient to convince such a person of the invention's asserted utility. (page 1566; emphasis added)

The Office has failed to carry this burden. As discussed below, applicants have asserted the specific and substantial utilities of using RIP15 (i) to inhibit RXR function in a subject for the treatment of a RXR-associated disease, such as hyperthyroidism, (ii) to identify a compound that increases RIP15 expression as a treatment for a RXR-associated disease (e.g., hyperthyroidism), and (iii) to generate an anti-RIP15 antibody for the detection or monitoring of a RXR-associated

disease (e.g., hyperthyroidism). Further, the Office has presented no credible evidence that would cause a person of ordinary skill to doubt the asserted utilities of the present invention. On these bases, this rejection should be withdrawn.

Specific Functions of RIP15

The present invention is based on applicants' discovery of a novel receptor, RIP15, that interacts with the retinoid X receptor (RXR). The specificity of the interaction of RIP15 with RXR is demonstrated by the lack of interaction between RIP15 and other nuclear receptors, such as TR, RAR, MB67, and GR (page 16, Table 1). Additionally, heterodimers of RIP15 and RXR bind DNA specifically. In particular, RIP15 binds a β -RARE (β -retinoic acid response element) in the presence of RXR. Moreover, applicants discovered that RIP15 completely blocks RXR-dependent transcription of a reporter gene linked to a β -RARE in a mammalian cell-based assay (page 24, lines 7 to 24, and Figure 9). Thus, applicants' specification demonstrates several important facts about RIP15 specificity that are the basis for applicants' asserted utilities.

Utility of RIP15 as a Therapeutic for the Treatment of a RXR-associated Disease, such as Hyperthyroidism

The disclosed ability of RIP15 to eliminate RXR-dependent activation of β -RARE linked genes strongly supports the specific utility of RIP15, analogs of RIP15, and fragments of RIP15 as therapeutics for the inhibition of RXR function in a subject (page 40, lines 8 to 19, and page 42). As stated on page 2, lines 14-24, of the specification:

members of the RXR family play important roles in several aspects of development and central nervous system differentiation as well as in adult physiology. Based on both their specific response to the 9-cis-RA metabolite and their heterodimerization with the RARs, it is clear that the RXRs play a central role in the broad regulatory effects of retinoids. Moreover, their heterodimeric interactions with other family members indicate that the

RXRs also play a central role in response to thyroid hormone, vitamin D, and perhaps other compounds.

From this disclosure, a skilled artisan would clearly understand that inhibiting RXR function is desirable for the treatment of diseases associated with an elevated level of hormone (*e.g.*, thyroid hormone, retinoic acid, or vitamin D) or hormone-mediated activity. For example, hyperthyroidism is caused by the production of too much thyroid hormone, and thus hyperthyroidism can be treated by inhibiting the body's response to thyroid hormone. Because RXR is required for full hormone-dependent transcriptional activity of the thyroid hormone receptor-RXR complex, administration of RIP15 to a subject with hyperthyroidism would be expected to reduce the adverse effects caused by the excess thyroid hormone and the resulting excess thyroid hormone receptor activity (page 2, lines 4-6).

Applicants note that these asserted disease associations are neither general in nature, nor are they inconsistent with what one skilled in the art would expect for the specific disease involvement of RIP15 based on applicants' disclosure of its ability to inhibit RXR function. Thus, applicants have asserted a specific, substantial, and credible utility with a "real world" context for RIP15 proteins.

Utility of Compounds that Increase RIP15 Expression as Therapeutics for the Treatment of a RXR-associated Disease, such as Hyperthyroidism

In addition to direct therapeutic use, RIP15 can also be used in standard methods to identify compounds that increase or decrease its expression and therefore its interaction with RXR (see, for example, page 34, line 28 through page 35, line 12). One skilled in the art would appreciate that compounds that increase RIP15 expression are also useful for the treatment of diseases associated with an elevated level of hormone or hormone-mediated activity (*e.g.*,

hyperthyroidism). Again, the asserted utility of identifying compounds for the treatment of hyperthyroidism satisfies the criteria for a specific and substantial utility. The credibility of this utility is strongly supported by the disclosed "central role in response to thyroid hormone" of RXR and the reasonable conclusion that inhibiting RXR function is desirable for the treatment of diseases associated with elevated thyroid hormone levels or activity (page 2, line 23).

Utility of Using an Anti-RIP15 Antibody for the Detection or Monitoring of a RXR-Associated Disease, such as Hyperthyroidism

RIP15 can also be used for the generation of anti-RIP15 antibodies for the detection or monitoring of RXR-related diseases (see, for example, page 40, line 20 through page 41, line 12). For example, anti-RIP15 antibodies can be used to detect decreased levels of RIP15, which are likely associated with increased risk or severity of RXR-associated diseases such as hyperthyroidism. Again, the credibility of this specific and substantial utility is supported by applicants' discovery of the ability of RIP15 to inhibit RXR function and the reasonable association of decreased RIP15 levels with increased RXR function. A skilled artisan would appreciate the high level of predictability between this increased RXR function and increased risk or severity of RXR-associated diseases such as hyperthyroidism. As the Examiner is aware, a compound (e.g., RIP15 protein) which enables the production of a useful end product (e.g., an anti-RIP15 antibody) is itself patentably useful under 35 U.S.C. § 101. *In re Kirk*, 376 F.2d 936 (C.C.P.A. 1967).

Utility of Using RIP15 to Purify or Isolate a β -RARE or β -RARE-linked Nucleic Acids

In addition to the above three utilities, the specification also clearly conveys that RIP15 is able to bind a β -RARE, a known and useful material. For example, Sucov *et al.* (U.S.P.N.

5,091,518, a copy of which is enclosed) reports that β -RAREs can be used to enhance transcriptional activity of promoters (abstract; column 1, lines 10-17; and column 2, lines 26-35).

In particular, a β -RARE can be added to a vector encoding a protein of interest to generate an "enhanced expression system" that is responsive to retinoic acid (column 5, lines 48-50 and column 8, lines 30-41).

The binding of RIP15 to β -RAREs allows RIP15 to be used to purify or isolate β -RAREs or β -RARE-linked nucleic acids. This utility would also have been apparent to one skilled in the art reading the specification, as binding of a β -RARE by RIP15 is discussed in the specification on pages 21 and 22. The use of RIP15 to isolate a β -RARE is sufficient to satisfy § 101. As noted above, RIP15 protein, which enables the production of a useful end product (e.g., purified β -RARE), is itself patentably useful under 35 U.S.C. § 101. In re Kirk, 376 F.2d 936 (C.C.P.A. 1967).¹

Four Credible, Specific, and Substantial Utilities have been Asserted

The analysis to be carried out in making a rejection under 35 U.S.C. § 101 must include a determination of whether an assertion of utility has been made in an applicants' specification and, if so, whether that asserted utility is credible (*i.e.*, whether the assertion of utility is believable to a person of ordinary skill in the art based on the totality of evidence and reasoning provided; M.P.E.P. § 2107.01-III(B)).

In the present case, applicants have asserted the utilities described above. Applicants submit that, absent data to the contrary, it is credible that administration of RIP15 protein or a compound that increases RIP15 expression will ameliorate RXR-associated conditions, and

¹ The Examiner is also reminded that a patent is presumed valid under 35 U.S.C. § 282. Accordingly, one may presume that the utility disclosed in Sucov for the claimed β -RAREs is a valid, credible utility.

further that detection of decreased RIP15 levels in a subject using an anti-RIP15 antibody will identify subjects at increased risk for these conditions. Nonetheless, while the Office has stated that these utilities are not credible, no evidence has been provided that may be relied upon to reach this conclusion, as the Guidelines require. In particular, the Guidelines state that the Examiner

must treat as true any statement of fact made by the Applicant in relation to the asserted utility, unless countervailing evidence can be provided that shows that one of ordinary skill in the art would have a legitimate basis to doubt the credibility of such a statement... [I]t is improper to disregard the opinion [of a qualified expert] solely because of a disagreement over the significance or meaning of the facts offered. (M.P.E.P. § 2107, emphasis added)

To be properly rejected under § 101, the Guidelines set forth that a case must represent one of those rare instances that meets the stringent criterion of being "totally incapable of achieving a useful result," *Brooktree Corp. v. Advanced Micro Devices, Inc.*, 977 F.2d 1555 (Fed. Cir. 1992), as cited in the Legal Analysis accompanying the Utility Examination Guidelines (M.P.E.P. § 2107.01-II). The only instances in which the federal courts have found a lack of patentable utility were where, "based upon the factual record of the case, it was clear that the invention could and did not work as the inventor claimed it did" (M.P.E.P. § 2107.01-II, emphasis added). These rare cases have been ones in which the applicant either (a) failed to disclose any utility for the invention, or (b) asserted a utility that could be true only "if it violated scientific principle, such as the second law of thermodynamics, or a law of nature, or was wholly inconsistent with contemporary knowledge in the art" (M.P.E.P. § 2107.02-IIIB).

Procedurally, the M.P.E.P. makes clear that the burden is on the Examiner to provide a detailed, reasoned explanation for the rejection that is supported, if possible, by documentary evidence indicating why the asserted utility is more likely than not "incredible." "An applicant's assertion of utility creates a presumption of utility" (M.P.E.P., § 2107.01-III(A)); "Where an

applicant has specifically asserted that an invention has a particular utility, that assertion cannot simply be dismissed by Office personnel as being 'wrong,' even when there may be reason to believe that the assertion is not entirely accurate" (M.P.E.P., § 2107.01-III(B)). Conversely, if the Examiner determines that the claimed invention has a credible utility, neither a 35 U.S.C. § 101 nor a related 35 U.S.C. § 112 rejection may be applied (or, upon rebuttal of the Examiner's position, both rejections must be simultaneously withdrawn).

In the present case, applicants assert four utilities in the specification, that are, on their face, credible. Applicants assert that the present invention provides RIP15 protein that can be used directly as a therapeutic, used to identify potential therapeutics that lead to decreased RXR activity, or used to generate diagnostic anti-RIP15 antibodies whereas, prior to the present invention, this was not possible because RIP15 was unavailable and its function was not known. At least some of the identified compounds that increase RIP15 expression are expected to have the proposed therapeutic activity of treating a RXR-associated disease (particularly hyperthyroidism). Furthermore, testing the identified compounds for their ability to treat disease can be carried out by those skilled in the art using routine experimentation. Additionally, one skilled in their art would appreciate that RIP15's ability to bind a β -RARE enables RIP15 to be used for the isolation or purification of a β -RARE from, for example, synthetic DNA libraries, genomic libraries, or cell lysates. No evidence has been made of record to dispute any of these utilities, and on this basis alone the rejection should be withdrawn.

RIP15 Ligand is not Required for Asserted Utilities

Finally, contrary to the position taken by the Office, Applicants note that none of the four asserted utilities presented above require the identification of a ligand for RIP15. In particular,

RIP15 and polypeptides derived from RIP15 can be tested for their ability to inhibit RXR in the cell-based assay described in applicants' specification on pages 23 and 24 or in any animal model of disease without the use of a ligand for RIP15. A RIP15 ligand is also not needed to identify therapeutic compounds that modulate RIP15 expression, to generate anti-RIP15 antibodies for diagnostic applications, or to purify a β -RARE. The basis for the rejection should be withdrawn.

Summary

In sum, given the numerous uses of RIP15 based on applicants' demonstration of the ability of RIP15 to interact with and inhibit RXR or to bind β -RAREs, the related rejections under 35 U.S.C. § 101 and § 112, first paragraph should be withdrawn. It is noted that all assertions must be shown to be incredible for this rejection to stand. It is applicants' understanding that the Office will either provide a rebuttal for each of applicants' assertions of utility or will withdraw these rejections in view of the clarifications which have been provided during prosecution.

Rejection under 35 U.S.C. § 112, first paragraph

Claims 7, 10, 13-16, and 27-31 also stand rejected under 35 U.S.C. § 112, first paragraph, for failure of the specification to convey possession of the scope of the claimed invention. In particular, the Office states that the essential feature of the claimed invention is the RIP15 sequence of SEQ ID NO: 3. Applicants respectfully disagree.

Applicants assert that 100% identity to the RIP15 sequence of SEQ ID NO: 3 is not essential to the present invention. In defining the term "RXR-interacting protein," the specification clearly teaches that proteins with at least 85% identity to RIP15 can also interact

with RXR:

By "RXR-interacting protein" is meant a polypeptide which directly or indirectly physically interacts with a retinoid X receptor in the in vivo protein interaction assay described herein.... Preferably, such a polypeptide has an amino acid sequence which is at least 85%, preferably 90%, and most preferably 95% or even 99% identical to the amino acid sequence of an interacting protein described herein (e.g., RIP14, RIP15, RIP110, or RIP13) at the point of interaction with the retinoid X receptor, or at least 80% and preferably 90% identical overall.

(Page 5, line 24 through page 6, line 5).

The specification further describes mutations that can be made to the RIP15 sequence to maintain the ability of the protein to interact with RXR. For example, page 6, line 26 through page 7, line 5 of the specification states:

By "substantially identical" is meant an amino acid sequence which differs only by conservative amino acid substitutions, for example, substitution of one amino acid for another of the same class (e.g., valine for glycine, arginine for lysine, etc.) or by one or more non-conservative substitutions, deletions, or insertions located at positions of the amino acid sequence which do not destroy the function of the protein (assayed, e.g., as described herein). Preferably, such a sequence is at least 85%, more preferably 90%, and most preferably 95% identical at the amino acid level to one of the sequences of Figs. 4, 5, 10, and 11 (SEQ ID NOS: 1-5).

Standard methods, such as those described on pages 41-43, can be used to generate proteins with at least 85% sequence identity to the disclosed sequence of RIP15 (SEQ ID NO: 3).

These proteins are structurally characterized by this high level of sequence identity to SEQ ID NO: 3. As 100% sequence identity to SEQ ID NO: 3 is not necessary for the claimed invention, applicants respectfully assert that it would be unfair to limit the present claims to only those proteins with 100% sequence identity to SEQ ID NO: 3.

Applicants further assert that one skilled in the art would appreciate that the essential feature of the claimed invention is the ability of the claimed proteins to interact with RXR. For example, page 3, line 30 through page 4, line 5 of the specification states:

In a second aspect, the invention features a substantially pure preparation of a

retinoid X receptor (RXR)-interacting protein. Preferably, the RXR-interacting protein is RIP14, RIP15, RIP110, or RIP13; or includes an amino acid sequence substantially identical to an amino acid sequence shown in any of Figs. 4, 5, 10, and 11 (SEQ ID NOS: 1-5); is derived from a mammal, for example, a human; binds a β -RARE site in the presence of RXR; or binds an EcRE site in the presence of RXR.

Applicants note that all of the pending claims include the functional limitation that the protein interacts with RXR. Applicants further note that the *in vivo* interaction trap assay described in the specification can readily be used by one skilled in the art to determine whether a protein with at least 85% sequence identity to the sequence of RIP15 (SEQ ID NO: 3) interacts with RXR (see, for example, pages 11-14). Alternatively, a skilled artisan can easily determine whether the protein interacts with RXR by determining whether the protein inhibits RXR-dependent activation of a β -RARE-linked nucleic acid (as disclosed, for example, on page 24, lines 7-24). Other standard methods for determining whether a protein interacts with RXR include gel filtration chromatography and co-immunoprecipitation assays.

In response to the Examiner's assertion that a functional limitation cannot be used to limit the claims because RIP15 is an orphan receptor, applicants respectfully assert that further characterization of RIP15, such as identification of a ligand for RIP15, is not necessary to distinguish the claimed proteins from other proteins. As stated in the Written Description Guidelines (66 FR 1106),

[f]actors to be considered in determining whether there is sufficient evidence of possession include the level of skill and knowledge in the art, partial structure, physical and/or chemical properties, functional characteristics alone or coupled with a known or disclosed correlation between structure and function, and the method of making the claimed invention. Disclosure of any combination of such identifying characteristics that distinguish the claimed invention from other materials and would lead one of skill in the art to the conclusion that the applicant was in possession of the claimed species is sufficient.

As noted above, the claimed proteins are distinguished from other proteins by both the structural characteristic of having at least 85% sequence identity to SEQ ID NO:3 and by the

specific functional characteristic of interacting with RXR. In contrast, RIP15 does not bind other receptors, such as TR, RAR, MB67, and GR (page 16, Table 1). Additionally, applicants note that the specification teaches other functional characteristics of RIP15. For example, RIP15 binds a β -RARE in the presence of RXR (claim 15) and inhibits RXR-dependent activation of a β -RARE-linked nucleic acid (claim 32). Based on applicants' disclosure of these properties and routine assays for determining whether a particular protein has these properties, one skilled in the art would appreciate that applicants were in possession of the claimed invention.

As multiple distinguishing characteristics that are shared by the claimed proteins are disclosed in applicants' specification, this rejection should be withdrawn.

Rejections under 35 U.S.C. § 102

Claims 7, 10, 13-14, 16, 27, 28, and 31 stand rejected under 35 U.S.C. § 102(e) as being anticipated by Liao *et al.* (U.S.P.N. 5,639,616). The Declaration of inventor Dr. David Moore, filed December 28, 2001, presented documentation of exemplary RIP15 cDNA sequence obtained prior to the November 10, 1993 filing date of Liao. The attached Declaration of Dr. Moore presents additional documentation of the sequencing of RIP15 prior to the filing date of Liao. In particular, Exhibit 1 contains the entire amino acid sequence of RIP15, which was predicted based on the sequence of the full-length RIP15 cDNA. Thus, RIP15 was characterized by its ability to interact with RXR and by its complete amino acid sequence prior to November 10, 1993. Because the claimed invention was reduced to practice prior to the filing of Liao, Liao cannot constitute prior art to the present claims under 35 U.S.C. § 102(e). Accordingly, this rejection should also be withdrawn.

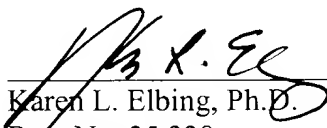

Conclusion

Applicants submit that this case is now in condition for allowance, and such action is respectfully requested.

If there are any other charges, or any credits, please apply them to Deposit Account No. 03-2095.

Respectfully submitted,

Date: 23 October 2002
